Executive Summary	
·	
Inspection Items	
Summary of All Inspections	9
Dental Inspections	12
Medical Inspections	16
Chiropractic Inspections	19
Podiatric Inspections	22
Veterinary Inspections	24

## **Executive Summary**

The Vermont Department of Health performs radiation inspections of facilities around the state that own x-ray equipment. These inspections are performed at different intervals depending on the type of facility. The National Council on Radiation Protection and Measurements (NCRP) recommends that medical facilities, including chiropractic facilities, be inspected every two years. Dental and veterinary facilities are recommended to be inspected every four years. Because podiatric x-ray machines are similar to dental units, podiatric facilities are also inspected every four years.

A total of 100 x-ray facilities were inspected in 2018. Out of the 100 facilities, 75 (75%) were in full compliance at the time of the inspection. Twenty-two (88%) of those facilities that were not in compliance came into compliance after the inspection. Overall, 94 out of the 100 facilities (94%) were in compliance thirty days after the inspection. Noncompliance items can be related either to facility issues (such as film processing and patient shielding) or to radiographic issues (such as patient or public exposure and the condition of the x-ray unit).

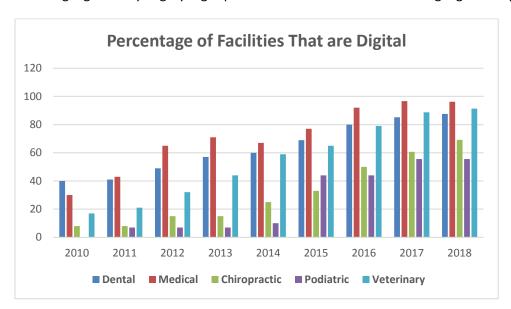

The use of film was the source of the most noncompliances in 2018. Facilities that utilize film imaging systems must ensure that their film, darkroom, and processing areas meet the requirements to provide appropriate diagnostic images. An additional area of concern in 2018 is the lack of review of personnel monitoring records. Facilities are required to provide personnel dose monitoring unless it can be demonstrated that employees will receive less than 10% of the maximum occupational dose limit. Facilities that provide dosimeters to monitor employees' radiation doses are also required to review the monitoring results with these employees on a periodic basis. The monitoring of dose levels is necessary to ensure that all personnel are taking steps to reduce dose. Another ongoing area of concern is the lack of satisfactory lead aprons. While lead aprons were available in all of the facilities inspected, some were stored improperly. If aprons are folded or otherwise not stored flat, they can develop creases and defects that reduce their effectiveness. The list of inspection items can be found on pages 5 to 8.

Annual dose rates to x-ray equipment operators at the facilities inspected were less than the Vermont maximum allowed limit of 5000 millirem and most were less than 1% of this limit. Annual dose rates to the public were less than the maximum allowed limit of 100 millirem at all inspected facilities.

Radiation doses to patients were less than the Vermont maximum allowed doses for all facilities. Please refer to the charts for each type of facility ("Dose to Patients per Exposure"). Vermont recommended doses and NCRP Diagnostic Reference Levels (DRL's) are shown for comparison and as goals for all facilities. DRL's are guides for reducing radiation dose while maintaining or improving image quality and are not intended to serve as regulatory limits.

Doses to the patient and the operator tend to be less for x-ray facilities that use faster speed film or digital imaging. For example, as the speed of dental intra-oral film increases from "D" to "F," the average patient dose per exposure decreases from 0.47 to 0.29 millirem. The use of digital x-ray decreases the average dose per exposure from 0.29 millirem for "F" speed film to 0.16 millirem for direct digital x-rays.

As more facilities begin to use digital x-ray systems, we should see decreases in the total facility noncompliances as darkrooms, film, and film processing are no longer needed. Approximately 88% of dental, 91% of veterinary, 96% of medical, 56% of podiatric, and 69% of chiropractic facilities in Vermont are using digital x-ray. Eighty-eight percent of all facilities are now using digital x-ray.

Exposures to the operator and to the public are measured at the configuration of highest exposure. Operator exposures are measured at the position the operator stands when making the exposure, as indicated by the facility. Exposure to the public is measured at the doorway while aiming the x-ray tube out of the exam room door (if possible) from approximately the patient position for an x-ray exam.

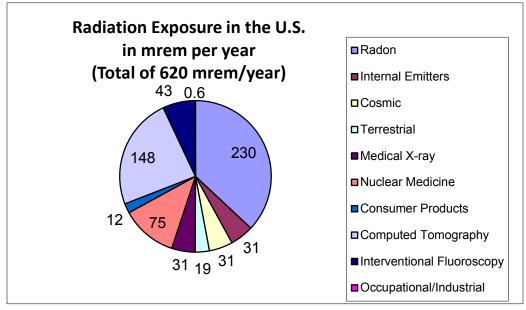

Operator and public exposures are measured in milliroentgen per hour using a Fluke 451B ion chamber. The exposure per hour is converted to annual dose in millirem using the number of x-rays the facility takes within a given time period. One milliroentgen is equal to 0.5 millirem (American National Standard Institute 6.1.1-1991) for whole body exposure from scattered radiation for operators and the public.

Patient entrance skin exposures (ESE's) are measured in milliroentgen using a RaySafe X2 detector, then converted to millirem using the factors in the following table based on the organ of greatest risk. Multiplication of the factor by the number of milliroentgen per exam results in the dose in millirem.

Exam Type	Factor	Organ
Dental	0.0015	brain
PA (posteroanterior) Chest	0.1044	lung
AP (anteroposterior) Cervical Spine	0.0435	thyroid
AP Thoracic Spine	0.1044	lung
AP Lumbar Spine	0.1044	stomach/colon
AP Abdomen	0.1044	stomach/colon
AP Retrograde	0.1044	stomach/colon
Lateral Skull	0.0218	brain
Hand	0.0087	skin
Wrist	0.0087	skin
Arm	0.1044	bone marrow
Shoulder	0.1044	bone marrow
Leg	0.1044	bone marrow
Knee	0.1044	bone marrow
Ankle	0.0087	skin
DP (dorsal-plantar) Foot	0.0087	skin
Lateral Foot	0.0087	skin

Adapted from National Council on Radiation Protection and Measurements Report No. 116 tissue weighting factors and conversion factor from roentgen to rad of 0.87 rad/roentgen.

The average radiation dose to a member of the U.S. population from both natural and man-made sources is 620 millirem per year, according to the National Council on Radiation Protection and Measurements (NCRP). On average, about 300 millirem is from medical uses of radiation.

Adapted from NCRP Report No. 160, 2009, Ionizing Radiation Exposures of the Population of the United States.

## **Inspection Items**

The following boxed sections indicate the individual items that are specifically checked during an inspection, divided into twelve general groups: the facility items of film/screen, processing, darkroom/safelight, personnel monitoring, and patient shielding; and the radiographic items of collimation, timer, kVp/filtration, patient entrance skin exposure criteria, public exposure criteria, operator conditions, and physical condition (of x-ray unit, shielding, etc.). These inspection items are drawn primarily from the National Council on Radiation Protection and Measurements (NCRP).

Some inspection items may pertain only to specific types of facilities. For example, lead gloves tend to be needed primarily while holding animals at veterinary facilities, while panoramic units are found only in dental facilities. Other inspection items apply to all facilities, such as public exposure limits.

New facilities are not cited for noncompliant items but are allowed a period of approximately one month to correct any noncompliant items found in the initial inspection.

Facility Noncompliance Items		
Film/Screen	Dental film is less than E speed	
	X-ray film speed is less than 400	
	Film is not protected from scatter radiation	
	Film is not stored properly	
	Film is exposed to chemicals	
	Out of date film is used	
	Film and screen types not matched	
	No screen installation date is on outside of cassette	
	Screen and cassettes are not of the same type or age	
	Screen cleaning interval is inadequate	
	Screen cleaning solution and lint-free wipes are not used per manufacturer	
	instructions	
	Cassette check is inadequate	
	Cassettes are not permanently identified for their type of use	
	Film viewbox is not available	
	Film viewbox is not cleaned periodically	
	Viewbox bulbs are not of the same intensity and color	
	Luminance of viewboxes is not similar	
	Viewbox bulbs are not replaced annually	
	Technique factors are not recorded in the patient log book	
	Left/right markers are not used on clinical radiographs	
	Clinical radiographs are not properly identified	

Film Processing Thermometer is not available for manual processing Timer is not available for manual processing Floating cover is not present for manual processing Sight development is used No evidence of daily log is kept Developing technique recommended by the manufacturer is not used Developer and fixer temperature are not maintained in limits Processor cleaning interval is inadequate Processor cleaning properly Processor cleaning properly Processor cleaning pate is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight Safelight bulb is greater than 15 watts Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not fire of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used Employee dosimeters are not properly used Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Satisfactory lead aprons are unavailable Satisfactory byroid shields are unavailable Lead aprons are improperly stored Lead aprons are into thecked for tears and holes (radiographically or visually) on at least an annual basis Individuals (e.g. parents/guardians) holding patients are not protected		
Floating cover is not present for manual processing Sight development is used No evidence of daily log is kept Developing technique recommended by the manufacturer is not used Developer and fixer temperature are not maintained in limits Processor cleaning interval is inadequate Processor is not operating properly Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight Safelight bulb is greater than 15 watts Safelight bulb is greater than 15 watts Safelight leaks are detected in the safelight housing Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not light tight Darkroom mis not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are inot checked for tears and holes (radiographically or visually) on at least an annual basis	Film Processing	Thermometer is not available for manual processing
Sight development is used No evidence of daily log is kept Developing technique recommended by the manufacturer is not used Developer and fixer temperature are not maintained in limits Processor cleaning interval is inadequate Processor is not operating properly Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not firee of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are inproperly stored		Timer is not available for manual processing
No evidence of daily log is kept Developing technique recommended by the manufacturer is not used Developer and fixer temperature are not maintained in limits Processor cleaning interval is inadequate Processor si not operating properly Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight  Safelight is bulb is greater than 15 watts Safelight is leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used or stored Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are inproperly stored		Floating cover is not present for manual processing
Developing technique recommended by the manufacturer is not used Developer and fixer temperature are not maintained in limits Processor cleaning interval is inadequate Processor is not operating properly Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight  Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory thyroid shields are unavailable Lead aprons are improperly stored Lead aprons are inconcepted for tears and holes (radiographically or visually) on at least an annual basis		Sight development is used
Developer and fixer temperature are not maintained in limits Processor cleaning interval is inadequate Processor is not operating properly Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight  Safelight bulb is greater than 15 watts Safelight leaks are detected in the safelight housing Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Lead aprons are improperly stored Lead aprons are incompeler sond checked for tears and holes (radiographically or visually) on at least an annual basis		No evidence of daily log is kept
Processor cleaning interval is inadequate Processor is not operating properly Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Developing technique recommended by the manufacturer is not used
Processor is not operating properly Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Developer and fixer temperature are not maintained in limits
Processor cleaning date is not recorded Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Processor cleaning interval is inadequate
Clean-up film for processing x-ray films (except intra-oral) is not run  Darkroom/Safelight Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Processor is not operating properly
Darkroom/Safelight  Safelight bulb is greater than 15 watts Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are incomplete stored Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Processor cleaning date is not recorded
Safelight is too close to the work area Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are inot checked for tears and holes (radiographically or visually) on at least an annual basis		Clean-up film for processing x-ray films (except intra-oral) is not run
Light leaks are detected in the safelight housing Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are inot checked for tears and holes (radiographically or visually) on at least an annual basis	Darkroom/Safelight	Safelight bulb is greater than 15 watts
Light leaks are detected in the safelight lens Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are incompleted Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Safelight is too close to the work area
Safelight is improperly filtered Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Lead aprons are improperly stored Lead aprons are inproperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Light leaks are detected in the safelight housing
Darkroom is not light tight Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Light leaks are detected in the safelight lens
Darkroom is not free of dust and dirt Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Safelight is improperly filtered
Daylight processor arm cuffs are not acceptable Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory dyroid shields are unavailable Lead aprons are improperly stored Lead aprons are incomplete (radiographically or visually) on at least an annual basis		Darkroom is not light tight
Daylight processor is not light tight Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Darkroom is not free of dust and dirt
Darkroom temperature and/or humidity are not acceptable Other light sources are present in the dark room  Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Daylight processor arm cuffs are not acceptable
Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Daylight processor is not light tight
Personnel Monitoring Personnel monitoring devices are required but not available Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Darkroom temperature and/or humidity are not acceptable
Control dosimeters are not properly used or stored Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Other light sources are present in the dark room
Employee dosimeters are not properly used Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis	Personnel Monitoring	Personnel monitoring devices are required but not available
Employee dosimeters are not properly stored No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Control dosimeters are not properly used or stored
No evidence of employee review of records Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Employee dosimeters are not properly used
Personnel monitoring records are incomplete No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Employee dosimeters are not properly stored
No radiation safety officer is designated for large practices Evidence of personnel holding film during exposure  Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		No evidence of employee review of records
Evidence of personnel holding film during exposure  Satisfactory lead aprons are unavailable Shielding Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Personnel monitoring records are incomplete
Personnel/Patient Shielding Satisfactory lead aprons are unavailable Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		No radiation safety officer is designated for large practices
Shielding  Satisfactory thyroid shields are unavailable Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		Evidence of personnel holding film during exposure
Satisfactory gonadal shields are unavailable Lead aprons are improperly stored Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis	Personnel/Patient	Satisfactory lead aprons are unavailable
Lead aprons are improperly stored  Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis	Shielding	Satisfactory thyroid shields are unavailable
Lead aprons are not checked for tears and holes (radiographically or visually) on at least an annual basis		, -
at least an annual basis		
Individuals (e.g. parents/guardians) holding patients are not protected		· · · · · · · · · · · · · · · · · · ·
		Individuals (e.g. parents/guardians) holding patients are not protected
No documentation of LMP (last menstrual period)		No documentation of LMP (last menstrual period)
Repeat rate analysis is not performed		Repeat rate analysis is not performed
Mobile equipment exposure switch cord is less than 6 feet long		Mobile equipment exposure switch cord is less than 6 feet long
Non-essential individuals are in the x-ray room during exposure		Non-essential individuals are in the x-ray room during exposure

<b>Radiographic Noncompl</b>	ance Items			
Collimation	X-ray beam is not restricted to the	e appropriate	area	
	X-ray beam is not restricted to the appropriate size			
	Collimator light is not aligned with the x-ray field			
	Collimation is not used in taking radiographs			
	Collimator light is not bright enou	Collimator light is not bright enough under normal room lighting		
	Collimator light problems (e.g. mi	rror broken, n	nirror obstructed)	
	Inadequate collimation is used for	r clinical radio	graphs	
Timer	Timer does not terminate exposu	re		
	Timer activates at zero			
	Timer is inaccurate			
	Timer repeatability is unacceptab	le		
	No deadman switch is available			
kVp and Filtration	kVp is greater than 10% of set val	ue		
•	kVp repeatability is unacceptable			
	Dental intra-oral x-ray is operating	Dental intra-oral x-ray is operating at less than 50 kVp or greater than 100 kVp		
	Filtration in beam is less than req			
	Technique charts are not available or up to date
